## 4 INTERNAL WIRING

## 5 SWITCHES

## Setting Address Switches:

Profibus addresses are set using the decimal number system from 1 to 99 . Set a unique Network ID by inserting a small Phillips screwdriver into the two identical switches as shown in the example.

6 LEDs

| Communication <br> LED | MEANING |
| :---: | :---: |
| RUN | Displays the status of the power |
| RDY | Displays the communication status of the communication module |
| ERR | Displays abnormal condition of communication module |

## 7 NETWORK CABLE

For detailed network information, refer to www.profibus.org.
a. A SmartStix module uses a 9-pin D-sub plug connector for its DP port. The pin assignment of the plug connector and the wiring are shown below.

Station 1 Station 2

b. It is necessary to terminate both ends of the network. Both terminations must have power to them to insure proper operation of the network. The following diagram illustrates the correct connection for the termination resistors. The diagram is for illustrative purposes only.

Note: Cabling and connectors need to be PTO-approved to achieve the desired performance results.

c. The shield braiding (and if present, the shield foil) must be connected to protective ground on both sides and must have good conductivity via shield clamps that cover as large an area as possible. In addition, it is recommended that the data lines be kept separate from all high-voltage cables.

## 8 INSTALLATION / SAFETY

a. All applicable codes and standards need to be followed in the installation of this product.
b. For I/O wiring (discrete), use the following wire type or equivalent: Belden 9918, 18 AWG or larger.

Warning: Consult user documentation. $\qquad$
